

Release Notes for...

Tocoman iLink 4.0.4

New Features

- Supports Windows 64bit operating systems.
- Faster communication with Tocoman Express Server.
- New tooltips added to the user interface.
- Classification macros and model's INP file are automatically added
- New visualization mode added (highlight).
- Support for wall's gross area added.

Solved Issues

- Instant quantification feature had problems, if model was updated during the quantity take-off. This caused quantities to “disappear” after re-starting Tocoman iLink. The problem is solved now.

Known Issues

- Model Browser's Overview tab is not updated automatically, if you e.g. create a new group. You need to close the window and re-open before different fields are updated.
- The order of grouping criteria in Model Browser's Advanced Wizard is not stored. This might affect the results, if you use the settings with various model versions.
- Sorting quantity columns uses a string based comparison instead of number. If you have e.g. values “1 m2”, “2 m2” and “101 m2”, the resulting order will be “1 m2”, “101 m2” and “2 m2”.
